TeamNite

Group 102: Tyler Lam, Dylan McConnell, Keelan Donovan, Johnathan Villa

Features and Description

TeamNite has the foundation of a great social gaming platform, but currently lacks the features needed to keep players engaged over time. Gaps in progress tracking, multiplayer accessibility, community interaction, and user privacy make the experience feel incomplete. We're proposing four key upgrades to change that. A badge and ELO system will reward players for wins and in-game achievements, making progress feel visible and meaningful. Automated matchmaking will make it easier than ever to find and join multiplayer games. AI-assisted forum tools will improve thread discovery and organization, encouraging richer, longer-lasting community discussions.

Finally, enhanced privacy and blocking controls will give users the ability to protect their profiles and feel safe interacting on the platform. With these additions, TeamNite becomes a more immersive, social, and secure experience.

Technology Stack & Design

We implemented our features on the existing GameNite starter code, improving the UI with CSS styling and React Bootstrap components. The badge system extended the existing user data model, matchmaking built upon Socket.io for real-time pairing, and forum improvements added AI-assisted search to the existing thread structure. Our CI/CD pipeline runs a Vitest suite checking ESLint formatting and backend tests, with both the frontend and backend deployed on Render.

Badges

Automated Matchmaking

AI Forum Search

Future Work

In the future, we would like to implement leaderboards for competitive play, allowing users to compete for top rankings and fostering a more competitive and engaging experience on the platform.

Demo & Source

Our demo site is available at <https://spring26-project-group-102.onrender.com/login> and our code is available at <https://github.com/neu-cs4530/spring26-project-group-102>

ABOUT

FriendLink is a full-stack social gaming platform built on the GameNite codebase. We added a persistent social layer (friends & private messaging), invite-only game coordination with shareable links, full profile customization with emoji/custom avatars, an achievements system, live online status indicators, and dark/light mode theming — converting a session-based game app into a lasting community.

Live Demo

<https://spring26-project-group-103.onrender.com/>

Source Repo

<https://github.com/neu-cs4530/spring26-project-group-103>

KEY FEATURES

Friends & Direct Messages — Send requests, accept/reject, block users, real-time notifications

Invite-Only Games — Private lobbies with shareable invite links; convert to public anytime

Profile Customization — Display name, bio, emoji or custom avatar, achievements badge system

Online Status — Live green/yellow/red dots; auto-away on idle; appear-offline mode

Dark Mode — CSS token theming; persists via localStorage; follows OS preference

In-Game Private Chat — Recipient selector in chat panel; public vs private message labels

TECH STACK & DESIGN

Client: React SPA, React Router, TypeScript, CSS custom properties
Server: Express REST API + Socket.io (real-time) + Keyv (storage)
Shared: Zod validation schemas & TypeScript types across packages
Monorepo: Three npm workspace packages: client / server / shared
Testing: vitest + testing-library (unit), Playwright (end-to-end)
Deploy: Render cloud hosting

Process & Workflow

- 3 agile sprints: Sprint 0 (planning), Sprint 1 (backend), Sprint 2 (frontend), Sprint 3 (polish & deploy)
- GitHub Projects board with issue tracking and short-lived feature branches
- Weekly TA check-ins supplemented by async standups between sessions
- All feature work merged to main only after at least one PR review

SCREENSHOTS

Profile Customization

Friends & Direct Messaging

WHAT'S NEXT

- Push notifications (email/mobile) for friend requests & DMs
- Group chats beyond one-to-one direct messaging
- More games and a plugin architecture for new game types
- Friend activity feed and game history timeline
- Migrate Keyv to a persistent DB (PostgreSQL / Supabase)
- OAuth login (Google / GitHub) for easier onboarding

GameNite Unlocked! enhances user engagement and improves connectivity through secure authentication, personalized profiles, new social features, and a rewarding achievement system.

Tech Stack & Design Decisions:

- Frontend: React, Typescript, Vite, Playwright
- Backend: Express. MongoDB, Vitest
- OAuth support with openid-client, secure session data with express-session, and email sending with nodemailer.
- Real-time gaming and chats are handled through Socket.io events,while forums, leaderboards, and profiles are exposed through REST API endpoints.

The backend combines Express route controllers with socket middleware that authenticates via session data, keeping real-time and REST flows consistent.

The app supports authenticated, interactive features like forum threads, game lobbies, leaderboards, and direct messaging. Server-side design emphasizes modular controllers and a clean API structure under /api. Frontend UI uses context providers, hooks, and error boundaries to manage auth state, theming, and runtime stability.

Group 104 -
Sara Sheikh
Alex Rosenthal
Brendan Ferguson
Stephen Sodipo

Group 105: NumberNite

Cali Behling, Sophia Allen, Claire Stewart, Chloe Yarnell

About NumberNite

NumberNite is a personalized, community-driven platform. Authentication, friend requests, friend lists, and private direct messaging allow users to form and maintain social connections. Profile customization, including profile pictures, bios, private profile options, and gameplay statistics, gives users a sense of identity and ownership. Forum upgrades, such as hashtags, search functionality, and topic-based groups, enable users to interact around shared interests. To further strengthen user connection and comfort, users can choose from several UI themes, including color and font personalization, creating a visually consistent and welcoming experience. Together, these features create a social space where users can play, connect, and express themselves, encouraging repeat engagement and a strong sense of community.

Design Decisions

For all of our newly implemented features, we kept our design consistent with the original GameNite codebase's design, worked to keep a separation of concerns, and maintained testability. For the backend, we kept the controller-service-repository architecture. For example, for backend files for forum groups, we had a separate forum service and controller. We also implemented custom hooks to reuse state logic in multiple places.

What's next for NumberNite?

NumberNite has potential for expansion by introducing new features that enhance user experience and strengthen community interaction. UI improvements could make the platform more seamless and intuitive to navigate. Adding more games would increase engagement, while expanding the forum functionality, such as enabling photo uploads, private and invite-only groups, would foster deeper user connections. Additional features like automatic logout after periods of inactivity, user blocking, and more advanced group filtering would further improve usability, security, and personalization.

Daily Duel

Nathalie Abello, Rachel Chen, Gabi Mitchell, Kae Strange

[Demo Site](#) * [GitHub Repo](#)

Daily Duel is an accessibility-friendly gaming site where players tackle shared daily maze challenges, play multiplayer games, and compare results on global leaderboards. Players earn badges for daily placements and win milestones, can share game results, and can customize their profiles and experience.

Tech Stack

- Typescript
- React
- Express
- MongoDB
- Render

Features

- Maze Game
 - Daily with AI Bot & Multiplayer
- Leaderboards & Badges
- Game Result Sharing
- Accessibility Friendly UI Options
- Profile Customization

LEADERBOARDS

	PLAYER NAME	TIME	DAILY BADGES
1	 NAT	1:34	
2	 YOU	1:45	

What's **NEXT** ➡

- More daily challenges
- Friending & private lobbies
 - friend only leaderboards, invite to private matches
- Push notifications
 - notify players when a new daily challenge drops or when a friend beats their score
- Badges that track streaks

Design Desicions

- Shared type layer
- REST & WebSocket split
- AI Bot as a regular player
- Daily challenge pulling from API
- Daily unique leaderboard socket

GAMENITE TAVERN

DEVELOPED BY IPEK OZCAN, LUKE CHRISTENSON, NIKHIL MENON, NICOLAS CRUZ

WE MAKE IT EASY TO PLAY GAMES WITH YOUR FRIENDS

Transform your casual mini-games into a competitive, real-time social platform. Play Nertz online built to replicate the in-person experience. You and your friends can now jump into lobbies with ease and track your progress with ELO rankings!

LOBBIES

Introducing lobbies! Get rid of the mess of joining multi-player games, and know who you're playing before starting the game.

TECH STACK

React + TypeScript + Vite (client), Express + Socket.IO (server), MongoDB/Keyv (data), shared Zod types.

WHAT'S NEXT?

Spectator Mode, Custom Avatars, Improved Caching Systems

DESIGN

Server-authoritative + race-safe Nertz state (fairness/correctness), Socket.IO real-time sync (instant multiplayer updates), dedicated Competitive Profile system with ELO and rank tiers.

ELO

Who's really the best player.. Now you don't have to ask! With a nuanced multi-person ELO system, ELO is calculated for *all* games, including Nertz! See your progress and win/loss history, and aim for the next rank.

Our most competitive game yet! With real-time updates, race your friends knowing the results are entirely skill.

NERTZ

FIND OUR PROJECT HERE!

NertzNite: <https://spring26-project-group-107-helloworld.onrender.com>

GitHub: <https://github.com/neu-cs4530/spring26-project-group-107-helloworld>

Kunal Wagle
Mihir Walvekar
Hunter Pong
Praveen Sinha

TECH STACK

Backend

- Socket.io
- Mongoose schemas
- Cloudflare R2 database for avatar uploads
- Google OAuth for SSO
- CI/CD hosted on Render
- GameLock for protecting from race conditions

Frontend

- Pictionary Websocket Canvas
- Accessibility ARIA - labels
- React - UI for home page/pictionary

USER EXPERIENCE

- Clanvas provides functionality for users to select between various preset themes (each with their own dark and light mode).
- Users can create their own custom theme to accomodate any color-blindness or vision impairment, and also adjust font size as needed.
- Clanvas allows users to link with Google OAuth for single sign-on, allowing easy and secure log in.
- Clanvas is completely tab-navigatable for accessibility purpo

PICTIONARY

- With the clans, Canvas users can play individual, team or clan based pictionary.
- Players can send challenges to other clans and select word difficulties as well as time and the number of rounds.
- Players take turns to draw and guess within a set time frame and see scores every round.

SOCIAL FEATURES

- Clanvas allows users to send friend requests, message and even form clans with other users on the website.
- Users can play against other clans and battle for Elo, where they can show off that their team is the best!
- Clanvas features per-game leaderboards for both solo/individual users and overall Elo ranking for each clan!

FUTURE WORK

While we were able to implement all the desirables and essentials from our plan, improvements could include the following :-

- Nudging a user that they're close when they guess something close to the actual answer in pictionary.
- Fixing the UI for accessing games and adding functionality like sorting the games by user, game type etc.
- Make the leaderboard worth points that can be redeemed for status, avatars etc.
- Add custom word banks to pictionary to make it more interesting.

STARRYNITE

TEAM 109

DEVELOPED BY ANYA LINDQUIST, MOKKH
MITSUNTISUK, EMILY TAYLOR, & HAMSA MADHIRA

OUR PROJECT

StarryNite is a social and gaming platform designed for night owls. Our platform includes new security features, DMs, more ways to interact on forums, and a new game type of UNO!

DEMO SITE: <https://spring26-project-group-109.onrender.com>

SOURCE REPO: <https://github.com/neucs4530/spring26-project-group-109-1>

FORUMS

- Upvote or downvote posts you like, and sort by votes
- Add tags to your post and filter based on tags
- React to posts with emojis!

DESIGN DECISIONS

- User Interface built using React
- Back-end server run on TypeScript
- MongoDB is used for the database
- The website is deployed through Render
- OTP are created and verified through otplib
- Email delivered through the Resend platform
- Password reset is on a separate route and page to avoid adding complexity to the login code
- Created new types to support direct message handling
- Client-side handling for filtering and sorting of forum posts and password requirements to avoid network latency

StarryNite

Home

Games

Forum

Profile

Messages (5 unread)

MESSAGING

- Search for anyone you want to talk to or choose from a list
- Get unread notifications on your sidebar in real time and for each DM
- See at a glance when the last response in chat was

SECURITY

- Toggle for 2FA
- Requires email – sends email notifications on login
- Requires a strong password
- Prevents 3 previous passwords from being used

UNO

- Play an entire game of UNO with up to 4 players
- Choose between 3 types: Standard, Flip, or Custom
- Add AI players to fill up remaining spots

WHAT'S NEXT

These are some additional features we would like to add for future users!

- CAPTCHA on login
- Profile photo for users
- DM toggle
- Ability to add or remove special cards from the UNO deck
- Hotkey for calling UNO

X

You can customize your profile, adding a banner, and a bio

×

Ship Hit Sunk Miss Unknown

- ▶ Built frontend with Windows-95 inspired theme with a component based framework
- ▶ Integrated Single Sign-On for secure login and session management across the platform
- ▶ Used MongoDB to manage user profiles, friends, clubs, leaderboards, forum posts, and game state persistence.
- ▶ Add more bullet points as needed for your project's tech stack.

- We plan to add more robust inter-club communication/interaction
- Adding more themes to give users more UI options
- Make battleship between clubs more intuitive
 - Allow each member to place a ship
- Allowing club members to play club-specific games within their club

KIMANITE!

CS4530 GROUP 111: ETHAN, DHRUV, DIO, NEIRIT

PROFILE CUSTOMIZE

Users can upload avatars, write bios, add personal links, connect Google/GitHub/Discord accounts through SSO, set profile visibility to public/friends/private, and rearrange profile sections.

LEADERBOARD

Global leaderboard ranked by wins with filtering by game type and time range, personal match history with filters, stat tracking on profiles, and 8 badges awarded automatically for milestones like win streaks and total games played.

SOCIAL FEATURES

Friend request system, direct messaging with a chat, user search by username or display name, online/idle/DND/invisible status indicators, user blocking that prevents DMs and friend requests, and DM privacy settings tied to profile visibility.

CATAN

Full implementation of Settlers of Catan with lobby creation and joining, turn-based gameplay with dice rolling, resource collection, building, trading, dev cards, robber mechanics, and real-time board state sync so all players see the same game state.

Problem Statement

The original GameNite website had almost no user personalization or community features. Users could only change their display name which made profiles feel plain and generic. There was no way to track improvement over time or compare yourself to other players, no friend system or direct messaging, and no way to search for people you've played with before. The gaming experience felt isolated. We also wanted to add a multiplayer strategy game so users could play something more complex together. Our goal was to turn GameNite into a personalized and social gaming platform for both competitive and casual players.

Future Work

The two extension features we didn't get to were performance graphs showing improvement over time and friends-only leaderboards. Adding charts to the profile page would let competitive players visualize their trends across different game types. We'd also want to improve real-time stability around edge cases like disconnects and duplicate events in the leaderboard and messaging systems. On the Catan side, handling mid-game disconnects gracefully (forfeit, skip turns, or pause) and supporting private invite-only lobbies would make the experience a lot better. A notification system for friend requests, game invites, and badge awards would also tie everything together.

Technology Stack & Design

We built on the existing GameNite codebase using TypeScript across the full stack. The frontend uses React with Chakra UI and the backend runs on Express with Socket.io for real-time communication. All data is stored through Keyv which provides an in-memory key-value store with a generic repository abstraction layer. Avatar images are uploaded to Cloudinary. SSO authentication uses Passport.js with Google, GitHub, and Discord OAuth strategies. The leaderboard uses a dual-storage approach with cached all-time stats for fast lookups and raw match history records for time-filtered queries, with Socket.io rooms for live push updates. Catan game state lives entirely on the server and syncs to all connected clients through Socket.io events. We used Vitest for unit testing, Playwright for end-to-end tests, and the app is deployed on Render.

Casino Nite!

[Live Demo](#)
[Source Repo](#)

Developed by Group 112:

Julen Marmol Martin

Seungwon Woo

Daniel Jacob

Ruixuan Yang

Casino Nite introduces a casino suite featuring Poker, supported by automated dealers and AI bots that enable single player and asynchronous engagement. Authenticated profiles power a virtual credit and rewards system and a variety of personalization features to make the experience unique. Some social features include friend requests, private messaging, and local leaderboards that visualize engagement over time.

Tech Stack:

- React
- Typescript
- Node.js
- Express
- MongoDB

Design Decisions:

- Bot micro-service
- Object storage using Supabase
- Email using Nodemailer
- Unified authentication layer
- Heartbeat & Sweep Mechanism

What's Next?:

- Display big/small blind amounts
- UI improvements for poker table (chips, dealing cards, etc.)
- Other casino games like BlackJack, Roulette
- Skill-based matchmaking
- Achievement Badges

LEAGUE OF CONNECTIONS

Group 113: Kevin Lu, Kevin Yang, Nathan Yan, Andrei Zubek

OVERVIEW

League of Connections (LoC) is a online browser-based competitive game platform that emphasizes ranked gameplay, structured discussion, and inclusive design.

DEMO SITE

2	Yao	SILVER	1020	10-9	
3	test	SILVER	1000	0-0	
4	Sénior Dos	BRONZE	960	4-6	
5	Frau Drei	BRONZE	940	3-6	
6	The Knight Of Games	IRON	680	9-25	

Chat with other users and invite them to play games!

Find new friends!

Participate in community tournaments!

TECHNOLOGY STACK & DESIGN DECISIONS

Our site features a Battleship game with 3 levels of AI opponents (random, BFS based, heatmap driven), an ELO system with a global leaderboard with live updates, and replay/history functionality. There’s also a community system with forums and tournaments, along with a friends and direct messaging system. Accessibility support for color blindness and different font sizes were implemented via React context providers and CSS variable mapping, and these settings persisted through user records.

WHAT’S NEXT?

Some features that we could add to LoC to improve the user experience include:

- Different Battleship grid sizes (10x10, 15x15)
- Allowing embedded images and videos in Community posts/comments
- Blocking users from sending direct messages
- Implementing AI chatbot to analyze game replays and give feedback on games

GemiNate

Group 114: Sean Walker, Lily Jawadiwar, Sree Kandula

[Source Repo](#)
[Public Demo Site](#)

GemiNate is a social gaming site that allows users to play synchronized games, interact with each other in communities, and listen to music together. It intends to give users a place to play together and socialize.

Blackjack

Communities

Jukebox

Blackjack uses a basic rule set for the game, and operates based on user input. Users make bets, hit or stand on their hands, and observe the dealer's cards as it draws. Underlyingly, the cards are a simple representation of a rank and a suit, and each user has a list of cards in order. One can think of these are "card areas."

Users can create private and public communities, and other users can join them from the communities tab, either from the list of joinable communities or through invites. They can then chat in the communities and interact with the community's music bar, as described below. The user who makes a community can set a banner, which shows up at the top of the community's page. Additionally, users can set their own profile pictures and pronouns, which will show up in the community's sidebar.

The Jukebox feature uses the Soundcloud API as the basis of finding and streaming music, with the intention of live broadcasting among clients. We used websockets as a way to manage bidirectional communication and the state of each music player. We consolidated the each music player into a "Playlist" type where each community housed one playlist. Users with DJ or Owner distinctions can control broadcast playback while individual clients can control volume. Music bar is persisted sitewide.

What's next?

Blackjack could implement more of its complex rules, such as splitting and doubling down. It could definitely also use animations.

Discord server style channels within communities could be a cool feature to allow users to customize their community experience a bit more. Emotes and image sharing would also be interesting.

We would love more of a live radio feature where similar songs could be automatically added to the queue once the end is reached. This could take responsibilities off of DJs and make the community's sound seem less recycled.

Group 115: Kevin Lee, Kevin Mei, Sophia Yang

Interactive web app that allows players to competitively play games against each other, climb the ranking leaderboards, and earn rewards through spectator betting and other in game rewards.

Tech Stack and Design Decisions:

GameZoo is a monolith app that features a Typescript backend, React frontend, MongoDB database, and Render deploy

Leaderboard + Stats + Rankings

- Statistics tracking and game ratings based on game performance
- Global leaderboards to compare top players

2 Player Spelling Bee Game

- 1v1 competitive spelling bee game with timed rounds and word scoring
- Rules similar to famous New York Times Spelling Bee
- Optional play against competitive AI, with ability to choose normal or hard

Currency System + Cosmetic Shop

- Accrue currency through playing games, daily logins, and spectator betting
- Use currency in the shop to purchase profile cosmetics

What's Next?:

Game Zoo will likely see development in more versus player games, more AI game integrations, more complex betting system with bigger payouts, player rank based matchmaking, as well as cosmetic expansions such as user customizable UIs and player badges.
