Tech Stack and Design

Friends and Messaging

Frontend: React, Typescript, CSS, Chakra-UI, Lucide, React Bits

Backend: Node.js, MongoDB

APIs: Claude API (LLM-based chat filtering), OAuth 2 API (profile link verification)

Key Design decisions:

Friends:

- FriendRequest and Friend structures, where requests track sender, recipient, and resolution (accepted/declined); Friendship decoupled from user profile to avoid consistency issues
- getFriendStatus used across features (e.g., private messages, private games)

Filtering:

- Claude allows for greater flexibility in moderation by acting as an overall "moderation assistant" as opposed to a model trained on specific categories of harmful messaging
- Custom prompt to determine safety and provide reasoning if message is not allowed

Direct Messaging:

- Real-time, persistent messaging between two friends outside of games creates a more social environment
- Notifications appear in the header of the site and in the direct messages list by tracking the "lastReadAt" timestamp so users never miss a message from a friend

User Statistics:

- UserStats records are keyed by username:gameType; isolating stats per player per game, with win rate calculated on-the-fly and leaderboard results filtered/aggregated across game types at query time

Profile verification:

- OAuth 2 API used for secure verification (PlaySpace does not need to store user credentials for other sites)
- Authorization code exchanged with external site (YouTube, Twitch) after user logs in to said site
- Profile link verified via username match

Bot Opponent:

- Bot opponent powered by Minimax (hard mode) and random move selection (easy mode)

Project Overview

SigmaNite Blackjack is a real-time multiplayer blackjack feature for the SigamNite platform. Players can browse tables, join games, place bets, and play synced rounds with a server-authoritative dealer. Additional features include sidebets, leaderboards, chat, tournaments, and AI explanations.

How It Works

1. Enter the lobby
2. Join/create a game
3. Bet & Play Rounds
4. Track stats & chat

Tech Stack / Design

Core Features

- Real-time tables
- Virtual currency
- Chat & reactions
- Leaderboards & tournaments

We used TS monorepo (React client, express + socket.io server) and focused on a server-authoritative game engine. We used Mongo for persistence and Groq LLM for our AI feature.

What's Next

- More variants of blackjack
- Other card based games
- Payment integration (i.e stripe)

CSINO online

Group 304

Play Now!

<https://spring26-project-group-304.onrender.com/login>

<https://github.com/neu-cs4530/spring26-project-group-304>

A

CSINO Online brings multiplayer poker to the GameNite platform! We now support Texas Hold'em, Omaha, and Pineapple.

Players choose between casual mode (no profile impact) and competitive mode (real profile balance at stake), with full 4-round betting, real-time pot updates, and hand evaluation at showdown.

A global leaderboard tracks competitive standings across all GameNite games, and an admin system lets room creators configure buy-ins, manage players, and send invitations. Accessibility features include dark/light mode, adjustable card and text sizes, ARIA screen reader support, and non-color-only visual indicators.

A

Frontend (React): component-based UI for the poker table, betting panel, leaderboards, and admin controls
Backend (Node.js + Express REST API): handles core game logic, user auth, balance management, and admin permissions
Real-time (Socket.io): orchestrates live game state sync across all players, turn enforcement, timer events, and leaderboard updates
Database (MongoDB): leverages a flexible document schema for user profiles, balances, game history, and room state

*Other key design decisions included keeping all authoritative game state server-side (preventing client cheating), routing balance deductions through separate casual vs. competitive logic, and using socket broadcast events to keep all clients in sync without polling.

Tech Stack

What's Next?

A

- Audio announcements: spoken alerts for turn changes, wins, and timer warnings to improve accessibility
- Keyboard-only navigation: full gameplay without a mouse, completing WCAG compliance
- Game history log: per-user record of past games, modes, and outcomes viewable on the profile page
- Additional poker variants: Short Deck, or other community card games using the existing variant rule engine
- Tournament mode: structured multi-table competition with blind escalation and elimination rounds

PROJECT OVERVIEW

Club 305 is a real-time multiplayer game platform featuring Texas Hold'em Poker as its flagship game. Poker supports up to eight players with optional AI opponents powered by a PPO neural network, following standard Hold'em progression with a 60-second shot clock, automatic side-pot handling, and a 10-second cooldown between hands. The platform includes a friend system for social connectivity, private game lobbies with invite-only access and host controls, and mid-game join support.

The platform is built around a ClubBucks economy, a sitewide currency earned through gameplay that can be spent in a cosmetic shop on card decks, chip themes, avatars, night mode, and 2x earnings boosts. Player statistics are tracked per game, with poker-specific metrics like VPIP% and PFR% visible on profiles and during gameplay.

TECHNOLOGY STACK & DESIGN

Our platform is a real-time multiplayer game site built with React, TypeScript, Node.js, and Socket.IO, enforcing a server-authoritative architecture where clients receive only filtered PokerView projections scoped to each player's visibility through a PokerState/PokerView type separation. The poker engine operates on a persistent table model with seat-indexed state, following an explicit round state machine (waiting → pre-flop → flop → turn → river → showdown) with server-side logic handling dealing, blinds, turn rotation, action validation, and side-pot construction from cumulative hand contributions. AI opponents are driven by a PPO actor-critic network trained in Python/PyTorch and deployed via ONNX, resolved through the same PokerMove interface as human players with difficulty controlling policy adherence (60/80/100%).

ClubBucks economy and cosmetics are persisted on MongoDB UserRecords, while poker-specific statistics (VPIP%, PFR%, contributed win rates) are isolated in a dedicated PokerStatsRepo to minimize write overhead. Friend requests live in a separate FriendRequestRepo for independent querying, with all social mutations and game invites broadcast over WebSocket to personal socket rooms for real-time sync.

FUTURE WORK

A possible extension to the features could be allowing users to purchase ClubBucks through real-life currency through Stripe API calls. This would allow those who do not have the time to play games to accrue ClubBucks quickly. We could also look into creating weekly poker tournaments that is set up automatically by the server which allow users to play with higher stakes and rewards.

On the AI side, we could train the PPO model on larger hand histories and incorporate player-adaptive behavior using the already tracked user metrics.

DEMO AND SOURCE

Our demo site is available at [DEMO URL], and our code at [REPO URL].

USABILITY UPDATES

UI Overhaul

- Dark Mode!
- UI Overhaul
- Login Persistence

Leaderboards

- User Points
- Popular Games

Games

- Daily Challenges
- Tutorial Bot
- Forfeiting

TECH STACK & DESIGN

Our stack used React, Express, and switched KeyV to Mongoose for MongoDB, allowing us native schema definition. We used BetterAuth to create user sessions, so users could stay logged in on their devices even on refreshes. We implemented a complete UI overhaul that utilized a custom component library we developed. Each page consisted of a gradient and a color that matched the navigation bar. Our notification and DM systems were built upon the existing SOCKET.IO setup from the starter code. Our profile pictures were stored as Base64 data that allowed us to store them in Mongo. We used event listeners to wrap all the daily objectives. The daily games and objectives are seeded by day to ensure each user gets the same objectives and daily levels to play. CICD was set up using GitHub Actions, which ran our unit and e2e tests, as well as basic lint checks. MongoDB Atlas hosted our database. OnRender was used for our site deployment.

- Game Statistics

NEW SOCIAL SYSTEM

Friends

- Add Friends!
- Direct Messaging
- Friend Status

Clans

- Leaderboards
- Spectating
- Clan Roles

WHAT'S NEXT?

- Select custom daily objectives to role out new features, or have gamers choose preferences and tailor it to them
- Add a wider selection of games, we added 2 with Minesweeper and CircleConnect
- Ability to join new games with your clan members, have Clans compete in tournaments against each other and chats exclusive to the Clan

PROJECT FRIENDLY ARE

Developed by Team 308 - Get OutPLYD (Paula Sefia, Leyuan Wang, Yutong Wu, David Busnel)
Tech Stack: TypeScript (React), Render, MongoDB, GitHub Actions, Jira

NEW FEATURES!

Friend System
Friend Groups
Game Rankings
Game Powerups
New Profile Pages

WHY THESE CHANGES?

While GameNite itself provides fun ways to play games with other users, we believe the service will be more engaging if users are able to foster a broader sense of community and enjoy friendly competition with one another!

FRIEND SYSTEM! GAME RANKINGS!

Meet someone cool? Want to play with your existing friends? Afraid of being forever alone? Send other users a quick friend request, and let the power of friendship work its magic!

Choose games that can influence your ranking! Compete with other users and win as many games as possible! Earn more points and improve your stats! Will you be the first player to reach the diamond rank?

FRIEND GROUPS!

Not done making friends? Take things to the next level! Create your own group of friends and bring everyone together! Jump into games made only for your group!

GAME POWERUPS!

Are you tired of constantly losing to other gamers?

Collect daily powerups that you can use in any game to get a competitive edge against your foes!

NEW PROFILE PAGES!

You need a profile as awesome as you are! Check out our improved profile pages! Keep playing to earn medals and show off your gaming prowess on your profile!

WHAT'S NEXT?

- Session Persistence
- Stay Signed In After Refreshing the Page
- Customizable Profile Pictures
- Top 10 Leaderboard as Service Continues to Scale
- Adding a light-mode-friendly version of the service
- Adding Friends via Display Name
- Tool to Limit Multiple Display Names and Usernames
- More Board and Card Games
- Renaming Friend Groups → Clans
- Gacha System

AnteUp!

Group 309

Olivia Lazar, Liam McCarthy, Ethan Moskowitz, & Aidan Roche

Description

AnteUp! is a gaming platform where users can play and watch a variety of games, bet on outcomes, and compete for real earnings using Ante Tokens — the platform's virtual currency. Players can fund their accounts, wager tokens during Texas Hold 'Em games, and build their reputation through a public leaderboard that tracks win rates and lifetime earnings. Viewers can also get in on the action by placing bets on ongoing games using player stats to inform their decisions. **AnteUp!** brings together the excitement of gaming, the thrill of betting, and a competitive community all in one place.

Tech Stack & Design Decisions

To develop **AnteUp!**, we built off of the initial GameNite platform which utilizes the MERN (MongoDB, Express, React, Node) stack for development. With GameNite as a base, we were able to implement new features to satisfy all of our new user stories. For betting, we added a player account balance that utilized sockets for real time updates. When a player joins a game, they add tokens from their account balance. At the end of the game, their balance updates with their winnings. Viewers bet using their account balance, so betting reduces their balance and winning a bet increases it in real time. For our user statistics, we tracked players' games ' history and tokens' history. Using live sockets, these statistics updated in real time in user accounts and the leaderboard. For our SSO, we utilized Google Authenticate. We used PayPal's sandbox API to let users securely add to their account balance, using fake credit card info. Additionally, we implemented bot players for our Texas Hold'em game, allowing players to play by themselves, and also allowed viewers to bet on these bots.

Future Work

Looking ahead, **AnteUp!** could expand in several meaningful ways. Future iterations could allow game creators to customize Hold'Em game parameters, give viewers a dedicated chat separate from players, and provide full visibility into all viewer bet outcomes. Peer-to-peer Ante Token transfers could further enrich the platform's social economy. Continued investment in account security and anti-cheat measures would also help ensure **AnteUp!** remains a fair and trustworthy environment as the platform scales.

Luana Siyoun, Ami Ashman, Logan Stanhope & Isabel Kendall

Project Description

- Initially, GameNite offered a limited selection of two-player games, which could make the multiplayer experience feel repetitive for users who want to play with others. Our team chose to address this issue by expanding the cooperative (co-op) game library with single-player, two-player, and multi-player options, such as Checkers, Solitaire, and Uno, to give players more choices and an overall more engaging shared gameplay experience.
- Regarding social features, users could initially only socialize with each other via chats during a game or forum comments. For users who hope to make friendships through GameNite and chat at any time, we introduced new social features to allow players to socialize and make friends outside of game chats and forum comments. We introduced new pages where users can befriend other users, see their friends' activity, and message friends at any time. To further create a social environment and make new friends, we added a tournament feature. The leaderboard for our tournaments incentivizes further playing to compete with friends and improve game-playing skills.
- We chose to name our project "FaceOff!" due to the introduction of new multiplayer games and tournament gameplay.

Technology Stack & Overall Design Decisions

- FaceOff! was built in Typescript using React and based on the initial implementation of GameNite.
- The new games involved both front-end development of React components and back-end service logic.
- But the Friends and Tournament feature was built using new front-end and back-end extension of the original codebase.

What's Next: Future Work

- We had initially proposed a user story with accessibility features, which aims to lessen the barriers to users with disabilities. These features would include:
 - Dark mode
 - Colorblind-friendly palettes
 - Keyboard navigation
 - Screen reader support
 - Adjustable text sizing
- We didn't implement any of our proposed extension conditions of satisfaction. Future work could implement those features, which include:
 - Notifications for new chat messages and friend activities
 - Filtering chat list and friends list
 - Ability to hide or customize status visibility
 - Solitaire: ability to undo moves
 - Seeding logic for tournament placement

Visual Demonstration of Main Features

New Games

Friends & Chats

Tournament

showdown!

Group 312

Developed by: Nick Ashizawa, Will Whelan, Sonia Cho, Vitor Prates

New Features

Showdown! is for competitive social gaming - transforming casual play into community-driven tournaments with built-in social features.

Tournament

- Users can create tournaments that other users can join
- Casual as well as ranked tournaments can be made
- Users gain or lose MMR based on ranked tournament wins/losses

Customization

- Users can add profile and header pictures to better express themselves
- Users can use Single Sign On to login to Showdown!
- Users can toggle between light and dark mode

Social

- Users can add or remove other users from their friends list or block users
- Private messaging or group chats can be made
- Users can directly invite friends to join their game

Links

- etc...

Faction Fight

A MULTIPLAYER WEB-BASED GAMING PLATFORM EXTENDED WITH SOCIAL AND COMPETITIVE FEATURES: A FRIENDS SYSTEM, PROFILE PERSONALIZATION WITH GAME STATISTICS AND EARNED BADGES, GOOGLE SSO LOGIN, LEADERBOARDS, AND FACTIONS (USER-CREATED TEAMS THAT CAN COMPETE AGAINST EACH OTHER). THE GOAL IS TO TURN A BASIC GAMING SITE INTO A SOCIALLY-DRIVEN PLATFORM THAT REWARDS ENGAGEMENT AND FOSTERS COMPETITION.

1. **Friends System** – send, accept, and reject friend requests. See what games your friends are playing. Block or unfriend users.

2. **Profile Stats & Badges** – view your win rates, game history, and streaks. Earn badges for individual and faction achievements. Pick a featured badge to show off.

3. **Factions** – create or join teams of up to 15 players. Invite members, chat privately, and challenge rival factions to game competitions.

4. **Leaderboards** – see top players per game, by badges, and by faction. Track your rank and how it changes month to month.

GITHUB: [HTTPS://GITHUB.COM/NEU-CS4530/SPRING26-PROJECT-GROUP-314](https://github.com/NEU-CS4530/SPRING26-PROJECT-GROUP-314)

SITE: [SPRING26-PROJECT-GROUP-314.ONRENDER.COM](https://spring26-project-group-314.onrender.com)

TECH STACK & DESIGN DECISIONS

FACTION FIGHT CONTINUED THE TYPESCRIPT MONOREPO, WHICH LETS US SHARE TYPES AND VALIDATION LOGIC WITHOUT DUPLICATING SCHEMAS. THE FRONTEND IS A REACT APP BUNDLED WITH VITE AND STYLED WITH TAILWIND CSS. THE BACKEND RUNS ON EXPRESS WITH SOCKET.IO LAYERED ON TOP TO POWER THE REAL TIME FEATURES. THE SHARED WORKSPACE CENTRALIZES ZOD SCHEMAS, GIVING US ONE SOURCE OF TRUTH FOR REQUEST VALIDATION ON THE SERVER AND TYPE-SAFE PARSING ON THE CLIENT. SERVER-SIDE PERSISTENCE GOES THROUGH A GENERIC REPO<T> ABSTRACTION BACKED BY KEYV, WHICH LETS US SWAP IN-MEMORY STORAGE FOR TESTS AND MONGODB FOR PRODUCTION WITHOUT CHANGING CALL SITES. WE CONSOLIDATE ALL REAL-TIME TRAFFIC ONTO A SINGLE USER-NOTIFICATION SOCKET.IO ROOM PER USER RATHER THAN ADDING A SEPARATE NOTIFICATION SERVICE. CONTROLLERS FOR FRIEND REQUESTS, FACTIONS, AND GAMES EMIT INTO THIS ROOM, AND A USENOTIFICATIONS HOOK SUBSCRIBES ONCE AND FANS EVENTS OUT TO COMPONENTS LIKE NOTIFICATIONTOAST AND THE PERSISTENT INVITE BANNER. WE CHOSE THIS BECAUSE SOCKET.IO WAS ALREADY PRESENT IN THE STARTER CODE, AND EXTENDING EXISTING INFRASTRUCTURE WAS SIMPLER THAN INTRODUCING A SECOND TRANSPORT. A BADGE SYSTEM AUTOMATICALLY EVALUATES INDIVIDUAL AND FACTION ACHIEVEMENTS WHENEVER A GAME COMPLETES. THE FEATURES ARE ORGANIZED INTO THEIR OWN CONTROLLER/SERVICE LAYERS AND REGISTERED AS EXPRESS ROUTES IN APP.TS. OUR VITEST + SUPertest SUITE TARGETS 90%+ BRANCH COVERAGE ON NEW CONTROLLERS AND SERVICES, PLAYWRIGHT COVERS THE HIGHEST-RISK END-TO-END FLOWS, AND CI RUNS LINTING, PRETTIER, AND THE FULL TEST SUITE ON EVERY PUSH.

WHAT'S NEXT:

WE AIM TO LET USERS STAR THEIR FAVORITE FRIENDS SO THEY ALWAYS APPEAR AT THE TOP OF THEIR FRIEND LIST, AND ALLOW FACTION LEADERS TO HAND-PICK WHICH MEMBERS COMPETE IN EACH CHALLENGE GAME. WE ALSO PLAN TO ADD LEADERBOARD PINNING, WHERE USERS CAN FOLLOW SPECIFIC PLAYERS AND GET NOTIFIED WHENEVER THEY WIN OR LOSE. ON THE PERSONALIZATION SIDE, WE WANT TO INTRODUCE CUSTOMIZABLE COLOR THEMES FOR PROFILE STAT DISPLAYS. LONGER TERM, WE SEE POTENTIAL FOR ADDING NEW GAME TYPES TO THE PLATFORM, EXPANDING BADGE CRITERIA TO REWARD SOCIAL ENGAGEMENT LIKE FACTION PARTICIPATION AND FRIEND ACTIVITY.
